#### ECE653

## Software Testing, Quality Assurance, and Maintenance Assignment 2 (70 Points), Version 1

Instructor: Werner Dietl Release Date: June 11, 2024

Due: 22:00, June 28, 2024 Submit: An electronic copy on GitLab

Any source code and test cases for the assignment will be released in the skeleton repository at <a href="https://git.uwaterloo.ca/stqam-1245/skeleton">https://git.uwaterloo.ca/stqam-1245/skeleton</a>,

I expect each of you to do the assignment independently. I will follow UW's Policy 71 for all cases of plagiarism.

#### **Submission Instructions:**

Please read the following instructions carefully. If you do not follow the instructions, you may be penalized up to 5 points. Illegible answers receive no points.

Submit by pushing your changes to the main branch of your GitLab repository in directory a2/. Make sure to use a web browser to check that your changes have been committed! The submission must contain the following:

- a user.yml file with your UWaterloo user information;
- a single pdf file called a2\_sub.pdf. The first page must include your full name, 8-digit student number and your uwaterloo email address;
- a directory a2q3 that includes your code for Question 3; and
- a directory wlang that includes your code for Question 4.

After submission, review your submissions on GitLab web interface to make sure you have uploaded the right files/versions.

You can push changes to the repository before and after the deadline. We will use the latest commit at the time of deadline for marking.

### Question 1 (10 points)

Consider the following program Prog1:

```
havoc x, y;
   if x + y > 15 then {
     x = x + 7;
     y = y - 12
   else {
5
6
     y = y + 10;
     x = x - 2;
9
   x = x + 2;
10
   if 2 * (x + y) > 21 then {
11
12
     x = x * 3;
13
     y = y * 2 
14
   else {
     x = x * 4;
15
     y = y * 3 + x };
17
   skip
```

- (a) How many execution paths does Prog1 have? List all the paths as a sequence of line numbers taken on the path.
- (b) Symbolically execute each path and provide the resulting path condition. Show the steps of symbolic execution as a table. An example of executing the first line is given below:

Edge	Symbolic State (PV)	Path Condition (PC)
$1 \rightarrow 2$	$x \mapsto X_0, y \mapsto Y_0$	true
	•••	•••

(c) For each path in part (b), indicate whether it is feasible or not. For each feasible path, give values for  $X_0$  and  $Y_0$  that satisfy the path condition.

# b) poth!

#### Question 2 (15 points)

(a) The constraint at-most-one $(a_1, \ldots, a_n)$  is satisfied if a most one of the Boolean variables  $a_1, \ldots, a_n$  is true. For example, at-most-one $(\top, \bot, \bot)$  is true, and at-most-one $(\top, \bot, \top)$  is false. Encode the constraint

$$at$$
-most-one $(a_1, a_2, a_3, a_4)$ 

into an equivalent set of clauses (i.e., in CNF).

(b) Show whether the following First Order Logic (FOL) sentence is valid or not. Either give a proof of validity, or show a model in which the sentence is false.

$$(\forall x \cdot \exists y \cdot P(x) \lor Q(y)) \iff (\forall x \cdot P(x)) \lor (\exists y \cdot Q(y))$$

(c) Show whether the following First Order Logic (FOL) sentence is valid or not. Either give a proof of validity, or show a model in which the sentence is false.

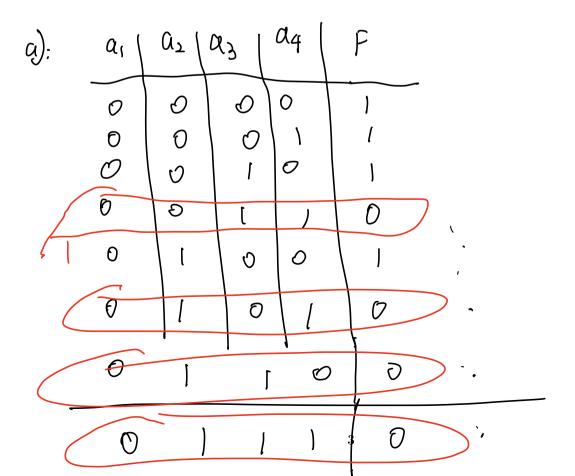

$$(\forall x \cdot \exists y \cdot P(x,y) \lor Q(x,y)) \implies (\forall x \cdot \exists y \cdot P(x,y)) \lor (\forall x \cdot \exists y \cdot Q(x,y))$$

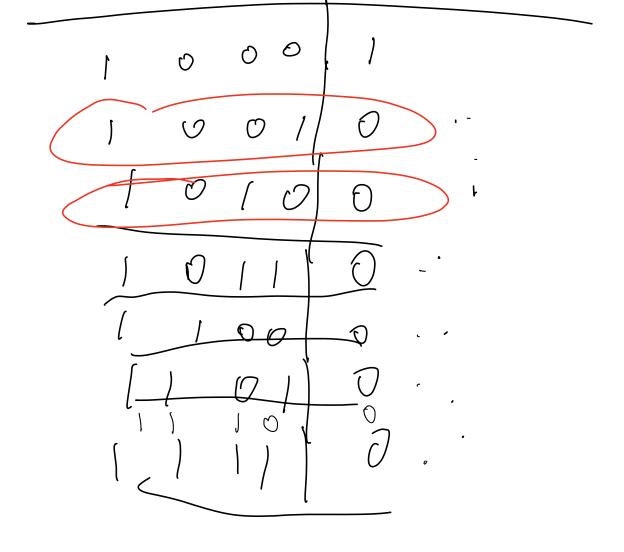

(d) Consider the following FOL formula  $\Phi$ :

$$\exists x \exists y \exists z (P(x,y) \land P(z,y) \land P(x,z) \land \neg P(z,x))$$

For each of the following FOL models, explain whether they satisfy or violate the formula  $\Phi$ .

- (a)  $M = \langle S_1, P_1 \rangle$ , where  $S_1 = \mathbb{N}$ , and  $P_1 = \{(x, y) \mid x, y \in \mathbb{N} \land x < y\}$ . Does  $M_1 \models \Phi$ ?
- (b)  $M_2 = \langle S_2, P_2 \rangle$ , where  $S_2 = \mathbb{N}$  and  $P_2 = \{(x, x+1) \mid x \in \mathbb{N}\}$ . Does  $M_2 \models \Phi$ ?
- (c)  $M_3 = \langle S_3, P_3 \rangle$ , where  $S_3 = \mathcal{P}(\mathbb{N})$ , the powerset of natural numbers, and  $P_3 = \{(A, B) \mid A, B \in \mathcal{P}(\mathbb{N}) \land A \subseteq B\}$ . Does  $M_3 \models \Phi$ ?
- (e) (Bonus question) Extend your encoding from part (a) to n variables and use at most (n) clauses and variables. If your solution is based on external resources, make sure to properly reference them.

((x) + x + y . P(x) + (x) + (x

Lo For every x those exists some y s.t. P(x) or Q(y) is true Proove 0>0

-> if . Pox) is true then @ is true because ( Xx. P(x)) istrue

-> if PW is false, then Q(y) must be true So Distrue D.C. (7y. DCY)) istrue

 $(2) \rightarrow (1)$  if  $\forall x \cdot P(x)$  is true then b.c. if for every x P(x) istrue

> xx. ∃y. P(x) YQ(y) is true because P(x) is true then there exists some to such that Q(yo)=true

tx. fy . P(X) (Q(y)) is true because there

exists some y s.t. Q(y)=true so \x . \forall y \cdot \( \text{P(x)} \v \text{Q(y)} istrue

b):

$$P(a,b) = false \qquad Q(b,b) = false \qquad M(p) = false \qquad$$

is true b.c. when x=a, P(a,b) v Q(a,b) is true when x=b, P(b,b) v Q(b,a) is true

 $\begin{array}{l} \text{I-I-S} \\ (\forall x \cdot \exists y \cdot P(x,y)) \vee (\forall x \cdot \exists y \cdot Q(x,y)) \\ \forall x \cdot \exists y \text{P.}(x,y) \text{ is always false, because } P(a, A), P(b, a) P(b, b) \text{ is false} \\ \forall x \cdot \exists y \text{P.}(x,y) \text{ is always false because } Q(b, b) = \text{false} \\ \forall x \cdot \exists y \cdot Q(x,y) \text{ is also false because } Q(b, b) = \text{false} \end{array}$ 

The FOL sentence is take

#### (d) Consider the following FOL formula $\Phi$ :

$$\exists x\exists y\exists z\, (P(x,y)\wedge P(z,y)\wedge P(x,z)\wedge \neg P(z,x))$$

For each of the following FOL models, explain whether they satisfy or violate the formula  $\Phi$ .

(a) 
$$(M) = \langle S_1, P_1 \rangle$$
, where  $(S_1 = \mathbb{N})$  and  $(S_1, Y_1) = (S_1, Y_1)$ , where  $(S_1, Y_1)$  and  $(S_1, Y_1) = (S_1, Y_1)$ , where  $(S_1, Y_1)$  and  $(S_1,$ 

(b) 
$$M_2 = \langle S_2, P_2 \rangle$$
, where  $S_2 = \mathbb{N}$  and  $P_2 = \{(x, x+1) \mid x \in \mathbb{N}\}$ . Does  $M_2 \models \Phi$ ?

(c) 
$$M_3 = S_3, P_3$$
, where  $S_3 = \mathcal{P}(\mathbb{N})$ , the powerset of natural numbers, and  $P_3 = \{(A, B) \mid A, B \in \mathcal{P}(\mathbb{N}) \land A \subseteq B\}$ . Does  $M_3 \models \Phi$ ?

# 1x12) 11 (ExEXE (P(X,Y)) P(Z,Y) 1 P(Z,X))

there exists x,y, Z st. P(x,y) = true and P(Z,y) = true P(X, Z)=true and (P12,x)= falge

## Question 3 (15 points)

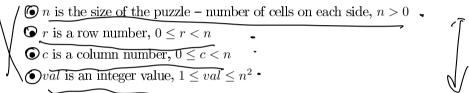

In recreational mathematics, n magic square is a  $n \times n$  square grid filled with distinct positive integers from 1 to  $n^2$  inclusive such that each cell contains a different integer, and the sum of the integers in each row, column, and diagonal is equal.

The following is an example of  $3 \times 3$  magic square:

- (a) Write down quantifier free constraints in First Order Logic to solve the puzzle above for any positive integer n.
- (b) Use Z3 Python API to implement a solver for magic square puzzles. Your solver should accept four parameters: n, r, c, val, where:

Your program should find a magic square of the given size n with the value val filled at location (r, c), assuming the top left corner corresponds to (0, 0).

Your solver should return a 2D array of integers corresponding to the solution. If there is more than one solution, just return any one of them. If there is no such magic square, your solver should return None. For example,

The skeleton for the solver is provided in a2q3/magic\_square.py.

You might find it helpful to use Z3 z3.Distinct(x) to create a constraint that states that all constants in the list x have distinct values. For example,

```
>>> x, y = z3.Ints ('x y')
>>> z3.Distinct (x, y)
x != y
```

(c) Extend the test suite in a2q3/puzzle\_tests.py with two additional set of parameters, and one extra set of parameters that does not have a solution (i.e., the solver returns None).

Recall that you can execute the test suite using the following command:

```
python -m a2q3.test
```

Sum for each your column, diagnost is the

$$\forall i$$
  $\forall j$   $\forall j$ 

where 
$$M = \frac{n(n^2+1)}{2}$$

$$N = \frac{\int_{0}^{2} x(n^{2}+1)}{n} = \frac{\int_{0}^{2} y(n^{2}+1)}{\sum_{n=1}^{\infty} x(n^{2}+1)}$$

### Question 4 (30 points)

Your GitHub repository includes an implementation of a parser and interpreter for the WHILE language from the lecture notes. Your task is to write a symbolic execution engine for it.

The implementation of the interpreter is located in directory wlang. You can execute the interpreter using the following command:

```
(venv) $ python3 -m wlang.int wlang/test1.prg
x: 10
```

A sample program is provided for your convinience in wlang/test1.prg

You can execute the interpreter using the following command:

(venv) \$ python3 -m wlang.sym wlang/test1.prg

and: 14H2t2 | 122 c

A skeleton for a symbolic interpreter is given in wlang/sym.py. It includes an implementation of a symbolic state in a class SymState. The class is provided for your convenience. You are free to modify it in any way or create your own.

You may find it helpful to look at the implementation of the concrete interpreter in wlang/int.py. Note that the concrete interpreter takes a State as input, and returns a single State as output. On the other hand, symbolic interpreter takes a symbolic state State as input, and returns a **list** of symbolic states as output, where each output state corresponds to some execution of the program. In general, the number of output states will be proportional to the number of execution paths in the program.

- (a) Implement symbolic execution of straight line code (i.e., programs without if- and while-statements);
- (b) Extend your answer to symbolic execution of programs with if-statements;
- (c) Extend your answer to symbolic execution of programs with while-statements. To handle arbitrary loops, assume that the loop is executed at most 10 times. That is, your symbolic execution engine should explore all feasible program paths in which the body of each loop is executed no more than 10 times.
- (d) Extend the test suite test\_sym.py to achieve 100% branch coverage of your implementation in parts (a), (b), and (c). Recall that you can run the test suite using

```
(venv) $ python3 -m wlang.test
```

and measure coverage of the test suite using

```
(venv) $ coverage run -m wlang.test
(venv) $ coverage html
```

(e) Provide a program on which your symbolic execution engine diverges (i.e., takes longer than a few seconds to run).

e) test. 15 in test. sym.py

```
test_15(self):
    prg1 = 'x:=100; havoc y; if x>10 then {if y > 10 then y:=y-1} else {if y < 10 the ast1 = ast.parse_string(prg1)
    engine = sym.SymExec()
    st = sym.SymState()
    out = [s for s in engine.run(ast1, st)]
    self.assertEquals(len(out),2)</pre>
```
